

Information on Non-Opioid Alternatives for the Treatment of Pain

Prescription opioids are sometimes used to treat moderate-to-severe pain. Because prescription opioids have a number of serious side effects, it is important for you to ask questions and learn more about the benefits and risks of opioids. Make sure you're getting the care that's right for you. This handout provides information about non-opioid alternative treatments.

You and your healthcare practitioner should discuss the advantages and disadvantages of each approach and develop a course of treatment using multiple methods and modalities, including prescription medications such as opioids. Pain management requires attention to biological, psychological, and environmental factors. Consider options so your treatment provides the greatest benefit with the lowest risk.

COLD AND HEAT: Cold can be useful soon after an injury to relieve pain, decrease inflammation and muscle spasms, and help speed recovery. Heat raises your pain threshold and relaxes muscles.

EXERCISE: Staying physically active, despite some pain, can play a helpful role for people with some of the more common pain conditions, including low back pain, arthritis and fibromyalgia.

WEIGHT LOSS: Many painful health conditions are worsened by excess weight. It makes sense that losing weight can help to relieve some kinds of pain.

DIET AND NUTRITION: Chronic pain may be the result of chronic inflammation. Some foods can increase inflammation and contribute to pain levels. Reducing or eliminating foods that increase inflammation may provide pain relief.

YOGA AND TAI CHI: Mind-body and exercise practices incorporate breath control, meditation, and movements to stretch and strengthen muscles. They may help with chronic pain conditions such as fibromyalgia, low back pain, arthritis and headaches.

TRANSCUTANEOUS ELECTRICAL NERVE STIMULATION (TENS): This technique employs a very mild electrical current to block pain signals going from the body to the brain.

OVER-THE-COUNTER MEDICATIONS: Pain relievers you can buy without a prescription, such as acetaminophen (Tylenol) or non-steroidal anti-inflammatory drugs (NSAIDs) like aspirin, ibuprofen (Advil, Motrin), and naproxen (Aleve, Naprosyn) can help to relieve mild to moderate pain.

TREATMENTS PROVIDED BY LICENSED HEALTHCARE PROVIDERS:

PHYSICAL THERAPY (PT) AND OCCUPATIONAL THERAPY (OT): PT helps to increase flexibility and range of motion which can provide pain relief. PT can also restore or maintain your ability to move and walk. OT helps improve your ability to perform activities of daily living, such as dressing, bathing, and eating.

MASSAGE THERAPY: Therapeutic massage may relieve pain by relaxing painful muscles, tendons, and joints; relieving stress and anxiety, and possibly impeding pain messages to and from the brain.

ACUPUNCTURE: Acupuncture is based on traditional Chinese medical concepts and modern medical techniques and provides pain relief with no side-effects by stimulating the body's pain-relieving endorphins. Techniques include inserting fine needles into the skin at specific points on the body.

CHIROPRACTIC CARE: Chiropractic physicians treat and rehabilitate using manual, mechanical, electrical, natural methods, physical therapy, nutrition and acupuncture. Chiropractors practice a hands-on approach that includes patient examination, diagnosis, and treatment.

OSTEOPATHIC MANIPULATIVE TREATMENT (OMT): Osteopathic physicians (DO) are educated, trained, and licensed physicians, but also receive additional training in OMT. OMT is a set of hands-on techniques used to diagnose, treat, and prevent illness or injury. OMT is often used to treat pain and promote healing, increase overall mobility, and treat other health problems.

BEHAVIORAL INTERVENTIONS: Mental health professionals can offer many avenues for pain relief and management. For example, they can help you reframe negative thinking patterns about your pain that may be interfering with your ability to function well in life, work, and relationships. Behavioral interventions can better manage your pain by changing behavior patterns.

TOPICAL TREATMENTS AND MEDICATIONS: Topical agents, including Anesthetics, NSAIDs, Muscle Relaxers, and Neuropathic Agents, can be applied directly to the affected areas to provide needed pain relief and typically have a minimal risk of side-effects due to low absorption of the medication into the bloodstream. Compounded topicals prepared by a pharmacist can be customized to the patient's specific needs.

INTERVENTIONAL PAIN MANAGEMENT: "Interventional" procedures might include an injection of an anesthetic medicine or steroid around nerves, tendons, joints or muscles; spinal cord stimulation; insertion of a drug delivery system; or a procedure to stop a nerve from working for a long period.

NON-OPIOID ANESTHESIA: Non-opioid anesthesia is an anesthetic technique using medications to provide anesthesia and post-operative pain relief in a way that does not require opioids. Anesthesiologists can replace opioids with other medications selected for their ability to block surgical and post-surgical pain. By replacing opioids and incorporating the variety of anesthetic and analgesic medications that block the process of pain, anesthesia providers can provide a safer anesthetic that avoids the adverse effects of opioids.

Discuss these alternatives with your healthcare practitioner and talk about the advantages and disadvantages of the specific options being considered. Depending on your insurance coverage, some options may not be covered, resulting in substantial out-of-pocket costs. Good communication between you and your healthcare practitioner is essential in building the best pain management plan for you.
